

Are fibroids cramping your style?

For millions of women with the condition known as **Uterine Fibroids**, symptoms like heavy periods, bloating, and pelvic pain or pressure routinely interfere with everyday life.

Approximately 7 out of 10 women develop fibroids during their reproductive years, and the condition is especially prevalent among women of color. Hysterectomy has long been used as a standard treatment for fibroids. In recent years, however, several treatments have become available that can treat fibroids and reduce or eliminate fibroid symptoms without harming the uterus.

Dr. Steve Yu from the Department of Obstetrics & Gynecology is now enrolling participants for a study comparing approved uterine-sparing fibroid treatments.

Women 18 or older with untreated fibroids who wish to receive treatment and avoid hysterectomy may be eligible to receive treatment through the TRUST (Treatment Results of Uterine Sparing Technologies) USA study. Information on the study can be found at www.ClinicalTrials.gov (search identifier: NCT02163525). For a medical consultation, please call (310) 451-8144.

To find out if you are eligible to participate in the study, contact:
