This week, we will begin a brief series on the emerging role of the microbiome in modulating neurologic disease. First up is a visit from Dr. Sergio Baranzini from UCSF. Sergio has done some pioneering work on the role of the microbiome in the pathogenesis of multiple sclerosis. He will provide us with a birds-eye view of how to study the microbiome in neurologic disease and dial down on specifics of the interaction between genetics and environment in MS. Please join us – The GRC

Grand Rounds Presents:

**The Gut Brain Axis: Emerging Evidence of its Role in Multiple Sclerosis**
