The UCLA Signal Processing & Auditory Perception Laboratory (SPAPL) is conducting a research study to evaluate how frequency mismatch affects spectral integration within and across ears in normal-hearing subjects listening to acoustic simulation of cochlear implants.

Participants must:
- Have normal hearing at both ears
- Use English as your primary language.
- Are at least 18 years old.
- Are in general good health and able to use computer for testing.

Compensation: Your participation in this study is on a volunteer basis; however, you will be reimbursed for your time and participation expenses ($15 per hour).

Location: UCLA SPAP Laboratory
CHS 62-113, David Geffen School of Medicine at UCLA
2100 West Third Street, Suite 100, Los Angeles, CA 90057

Study Information:
- You will have a hearing screening test to determine if you are appropriate for this study.
- You will listen to sounds or speech delivered through headphone or loudspeakers and identify or make judgements about what you have heard. (e.g., “repeat back the sentence you heard”; “identify the word you heard”; “identify the location of the sound”, etc.).
- The speech and sounds you hear may be filtered and changed to sound like they are produced by a cochlear implant.
- Research sessions will be scheduled at your convenience when possible.
