Children’s Attention Tracking (C.A.T) Research Study

We are enrolling children 6-10 years old to participate in a neuroscience research study exploring the ways in which different learning online and in person influence children’s attention.

If your child qualifies to participate in this study, you all will be invited to a single lab visit that will take **2-2.5 hours**. Your child will be engaged in learning activities with our research team while they wear a cap that measures brain activity. We will also ask you to fill out surveys about your children’s behavior. Since we are interest in understanding your child’s attentional skills, as a result your child may qualify them for a full diagnostic assessment of ADHD-related behaviors.

Participation in the study will result in a **$100** cash compensation.

If you are interested in participating, please contact the Bear Lab:
